

- Estimated Distance: Apply a standard physics model (approx. 5ft of distance per 1mph EV at a 25-degree launch angle).
1. MLB COACHING ENGINE:
- Create a "Pro Scout Report" section. Instead of generic advice, focus on "Swing Efficiency."
 - If the AI detects "Casting" (arms extending too early), recommend the "Alligator Arms Drill."
 - If the AI detects "Dropping the Barrel," recommend "Top Hand/Bottom Hand Isolation Drills."
 - Provide a "Squared-Up Rate" estimation based on the depth of contact relative to the front foot.
1. USER INTERFACE (UI):
- Design a "Dark Mode" aesthetic using Slate-900 and Emerald-500 (MLB Statcast style).
 - Display a "Metric Dashboard" next to the video player with real-time gauges.
 - Include a frame-by-frame "Scrubber" that allows the player to manually verify the AI's "Contact Point" timestamp.
 - Add a "Compare to Pro" feature that overlays the user's joint angles against a generic "Elite Profile" (ideal hip-rotation timing).
1. DEPLOYMENT & LOGIC:
- Ensure the app can be deployed to Google Cloud Run directly
